

Safe Staffing Fact Sheet

When nurses are assigned to care for too many patients, patients are at risk. Healthcare administrators are forcing nurses to take on 9, 10, or even more patients at once.

There is a solution: legislated safe nurse-to-patient standards. Safe nurse-to-patient standards saves lives – and can help save money for our healthcare system. The healthcare workers safe staffing coalition support legislation that will require all acute care facilities to meet minimum nurse-to-patient staffing ratios. The bill would also require all residential healthcare facilities to comply with minimum care hours for registered nurses, licensed practical nurses and certified nurse aides.

1 Safe Staffing Saves Lives

- The number of patients assigned to a nurse has a direct impact on our ability to appropriately assess, monitor, care for and safely discharge our patients.
- Outcomes are better for patients when staffing levels meet those established in California Research demonstrates lives are saved, quality of care is improved and hospital stays are shorter in other states, when hospitals meet the CA staffing benchmarks (*Health Services Research, 2010*).
- Hospitals which routinely staff with 1:8 nurse-to-patient ratios experience five additional deaths per 1,000 patients than those staffing with 1:4 nurse-to-patient ratios (*Journal of the American Medical Association, 2002*).
- The odds of patient death increases by 7% for each additional patient the nurse must take on at one time (*Journal of the American Medical Association, 2002*).

2

Safe Staffing Reduces Adverse Patient Outcomes in Hospitals and Nursing Homes

- When registered nurse staffing is increased by only 5%, the number of adverse events, including pressure ulcers, catheter-associated urinary tract infections, hospital acquired injuries, air embolism, blood incompatibilities, vascular catheter associated infections and mediastinitis following coronary bypass graft, are reduced by 15.8% (*Quality Management in Health Care, 2010*).
- Hospitals with lower nurse staffing levels have higher rates of pneumonia, shock, cardiac arrest, urinary tract infections and upper gastrointestinal bleeds; all leading to longer hospital stays, increased post-surgical 30-day mortality rates and increased rates of failure-to-rescue, i.e. death of a surgical patient following a hospital-acquired complication (*Agency for Healthcare Research and Quality Pub. No. 04-0029, 2004*).
- In nursing homes, safe staffing standards have a positive impact on both facility processes and on resident outcomes, for example, fewer facility deficiencies for poor quality and improved functional status of the residents (*Health Services Research, 2012*).
- There is a correlation between unsafe staffing and high nurse turnover, and in nursing homes, research has also shown that as nurse turnover increases, the quality of resident care declines which results in more frequent use of restraints, urinary catheterization, and psychoactive drugs; increased risk of contractures, pressure ulcers and other adverse patient outcomes (*Gerontological Nursing, 2008*).

3

Safe Staffing is a Cost-Effective Way to Improve Patient Care and Can Lead to Savings for Hospitals and our Healthcare System

- In California, hospital income rose dramatically after safe staffing standards were implemented, from \$12.5 billion from 1994 to 2003, to more than \$20.6 billion from 2004 to 2010. Not one California hospital closed because of ratio implementation.
- When compared to other 'life-saving' interventions, nurse staffing is a cost-effective way to improve patient care. (*Nursing Administration Quarterly, 2011*)
- Safe nurse staffing reduces turnover in hospitals. Inadequate staffing levels are correlated with nursing turnover and poor patient satisfaction. The average cost to replace an RN ranges up to \$88,000. (*Nursing Administration Quarterly, 2011; The Journal of Nursing Administration, 2008*)
- Safe staffing in hospital intensive care units saves lives. A nurse-to-patient ratio of 1 RN to 1.5 patients (or less) is independently associated with a lower risk of in-hospital death. Higher nursing care hours per ICU patient day significantly contribute to prevention of Central Line-Associated Bloodstream Infections. (*Critical Care Medicine, 2014; Nursing Care, 2013*)
- When regular (non-overtime) RN staffing is higher on a unit, patients report higher quality discharge teaching and are less likely to be readmitted within 30 days—saving patients and their insurers \$608 per patient hospitalized. (*Health Services Research, 2011*)
- Increased RN staffing helped hospitals reduce penalties for avoidable readmissions. For Medicare patients with heart attacks, heart failure or pneumonia, this study found hospitals with high nurse-staff ratios had 25% lower odds of being penalized and 41% lower odds for the maximum penalty for readmissions by CMS (*Centers for Medicare & Medicaid Services*). (*Health Affairs, 2013*) based on quality of care (*CMS.gov, 2013*).

4

Research Establishes Ratios and Hours of Care

- The hospital nurse-to-patient ratios specified in the Safe Staffing for Quality Care Act are based on peer-reviewed academic research, evidence-based recommendations from scholarly entities and lessons learned from California's experience implementing nurse staffing ratios. The minimum care hours specified for nursing homes are also based on research evidence and the recommendations of the Institute of Medicine's report, *Keeping Patients Safe: Transforming the Work Environment of Nurses* (2004).

Proposed Ratios

All intensive care 1:2

Emergency critical care 1:2

Trauma emergency unit 1:1

Operating room 1:1

Post-anesthesia care 1:2

Labor - stage 1 1:2

Labor - stages 2 & 3 1:1

Antepartum 1:3

Non-critical antepartum 1:4

Newborn nursery 1:3

Intermediate care nursery 1:3

Postpartum couplets 1:3

Postpartum mother-only 1:4

Well-baby nursery 1:6

Pediatrics 1:3

Emergency Department 1:3

Step-down & telemetry 1:3

Medical/surgical 1:4

Acute care psychiatric 1:4

Acute care psychiatric 1:5
